

AI-Powered Job Application Tracker

Project Overview

Build a Django-based web application where users can manage and track their job applications from a single dashboard.

Users can add jobs, update application status, manage interview information, search applications, and use AI to analyze job descriptions.

Core Features

User Authentication

- User Registration
- Login & Logout
- User-specific application management

Job Application Management

- Create Application
- Application Listing
- Application Detail View
- Edit Application
- Delete Application

Application fields may include:

- Job Title
- Company Name
- Job Description
- Location
- Salary
- Job URL
- Application Date
- Status
- Notes

Application Status

Wishlist → Applied → Screening → Interview → Selected / Rejected

Search & Filtering

- Search by job title/company
- Filter by status

- Filter by location/category
- Categories & Tags

Interview Management

- Interview Date & Time
- Interview Type
- Meeting Link
- Interview Notes

AI Features

Students must implement **at least one AI feature**.

Recommended:

AI Job Description Analyzer

- Job Summary
- Required Skills
- Required Experience
- Important Technologies
- Interview Preparation Suggestions

Optional:

- AI Job Match Analysis
- AI Interview Question Generation

Dashboard

Display:

- Total Applications
- Applications by Status
- Recent Applications
- Upcoming Interviews

Suggested Django Concepts

- Models & Django ORM
- CRUD Operations
- Forms / ModelForms
- Authentication & Authorization
- Model Relationships
- Search & Filtering
- Templates

- External AI API Integration

Required UI Pages

- Registration
- Login
- Dashboard
- Application List
- Application Details
- Create/Edit Application
- AI Analysis

Submission

Students must submit:

1. GitHub Repository URL

2. UI Screenshots OR Demo Video

The GitHub repository should include the complete project, `requirements.txt`, README, and setup instructions.

Do not upload API keys or passwords to GitHub.
